Onix-Export from VERDE

5th IGeLU Conference, Ghent 30 August - 1 September 2010

Andreas Sabisch

sabisch@ub.fu-berlin.de

Onix-Export to EZB

- Ex Libris create a utility (in Perl) for an ONIX-Export from VERDE
- Aim: Automatically transfer of changing data in VERDE to the german electronical Journal Database (EZB)
- Use:
 - Export all Data from VERDE
 - Calculate the difference to the last export before (no export – no difference)
 - Calculate an ONIX-File from the difference
 - Send this file to EZB; in EZB a nightly update will start
 - A file tab_skip include targets, which will not exported (i.e. Targets with free journals, aggregator targets, bok targets)
