 📀📀📀📀📀📀📀📀📀📀📀📀📀📀📀📀📀📀📀📀📀📀📀📀📀📀
 📀📀📀📀📀📀📀📀📀📀📀📀📀📀📀📀📀📀📀📀📀📀📀📀📀📀

Why?

- Large consortium – Cannot keep statistics around for more than two or three months
- Too much of a burden for everyone to collect stats manually each month or two
- Security – No data loss even if someone forgets to pull the stats
- Automation of slow things
- Less burden on the server

What?

- 9 different stats
 - Searches
 - Searches in quicksets
 - Sessions
 - Items in my databases *
 - Items in my e-journals *
 - Items in e-shelf *
 - Saved searches *
 - Alerts *
 - Links to native interface

* Total number currently

How?

- A single Perl script
- Runs cron'd every 1st of a month
- Gathers the statistics for all institutions
- Direct SQL
- Goes through a list of recipients and sends institutional stats as attachments
- Separate messages for all stats, easy to store
- Tab-separated data, easily loadable to spreadsheet

So?

- Initial grinding of teeth because of the periodical stats cleanup
- Saves a lot of work
- Creates some more work
- Users would rather analyze the whole year at once..
- Probably a non-issue in a single institution where stats can be kept for the whole year
