

# The Year in Search: Exploring User Search Behavior with Generative AI

Marlene van Ballegooie, University of Toronto Libraries  
IGeLU Conference – Siena, Italy – September 17, 2025

# Why Study User Search Queries?

Investigation into the use of AI to analyze user search queries from the Library's discovery system

Why study user search queries?

- Understand user needs and behaviors
- Highlight access and discovery barriers
- Refine discovery system relevance ranking
- Identify opportunities for library instruction
- Track emerging trends and research interests
- Inform collection development

# Research Questions

Can AI be used to accurately categorize search queries and derive meaningful insights into user search behavior?

How do users interact with our discovery system?

- What subjects/topics do they search?
- What types of searches do they do? (i.e. title, author, subject/concept)
- What is the intent behind their search activity?

# Project Scope

## Proof of concept project

- Mixpanel – New data analytics platform for PrimoVE
- Google Gemini 2.5 Pro

## Big data set

- From April 9, 2024 - April 8, 2025 = 11,388,948 user searches
- Analyzing ALL user queries was not possible due to sheer volume and current limitations with AI tools
- Analyzing only most frequent searches may hide nuances in user behavior

# The Year in Search

Create a representative sample from the past year to analyze trends more comprehensively

- All queries with more than 5 searches (203,849 unique queries)
- Random sample of 1% of all queries searches 5 or less times (58,802 unique queries)
- Total data set = 262,651 unique queries, representing 2.5 million individual user queries (22% of all searches in past year)

# **Gemini Gems: The AI Workhorses**

# Subject Categorizer

Assigned three subject terms to each search query (not based on LC Subject Headings)

Mapped each query to a top-level subject category using the Thema classification scheme

Each Thema classification mapped to a broader academic discipline:

Arts & Humanities	Clinical, Pre-Clinical & Health
Engineering & Technology	Life Sciences & Physical Sciences
Social Sciences	

# Search Type Categorizer

Classified each search query into one of the following categories:

- Title (with a more granular ‘type’ attribute, i.e. journal article, book, database, etc.)
- Person/Entity
- Subject/Concept
- Unknown

# User Intent Categorizer

Identified the underlying motivation behind the search

Categorized search queries into one of six user intent types:

- Specific Item Intent
- Known Entity Intent
- Specific Topic Intent
- Keyword-Driven Intent
- Exploratory Topic Intent
- Unknown Intent

# Examples of Title Searches

78401 | 6 | How Infrastructure Works | Civil Engineering | Urban Planning | Public Works | Technology, Engineering, Agriculture, Industrial processes | Engineering & Technology | title [Book] | Specific Item Intent

NAMED A BEST BOOK OF 2023 BY *PUBLISHERS WEEKLY*

"Revelatory, superbly written, and pulsing with wisdom and humanity, *How Infrastructure Works* is a masterpiece." —Ed Yong, author of *An Immense World*

A new way of seeing the essential systems hidden inside our walls, under our streets, and all around us

Infrastructure is a marvel, meeting our basic needs and enabling lives of astounding ease and productivity that would have been unimaginable just a century ago. It is the physical manifestation of our social contract—of our ability to work collectively for the public good—and it consists of the most complex and vast technological systems ever created by humans.

A soaring bridge is an obvious infrastructural feat, but so are the mostly hidden reservoirs, transformers, sewers,... [Keep Reading](#)

# Example of Person/Entity Searches

139052 | 11 | Stubbs, C. W. | Astrophysics | Cosmology | Experimental Physics | P – Mathematics and Science | Life Sciences & Physical Sciences | person/entity | Known Entity Intent

### Christopher W. Stubbs - Harvard Department of Physics

Christopher Stubbs is an **experimental physicist** working at the interface between particle physics, cosmology and gravitation.

### About

Christopher Stubbs is an experimental physicist on the faculty at Harvard University in both the Department of Physics and the Department of Astronomy. He is the former Dean of Science at Harvard University and a former chair of Harvard's Department of Physics. [Wikipedia](#)

# Example of Subject Searches

52627 | 15 | Dead Sea scrolls | Archaeology | Biblical Studies | Ancient Manuscripts | N – History and Archaeology | Arts & Humanities | subject/concept | Specific Topic Intent

# Search Frequency and User Behavior

Highly skewed distribution:

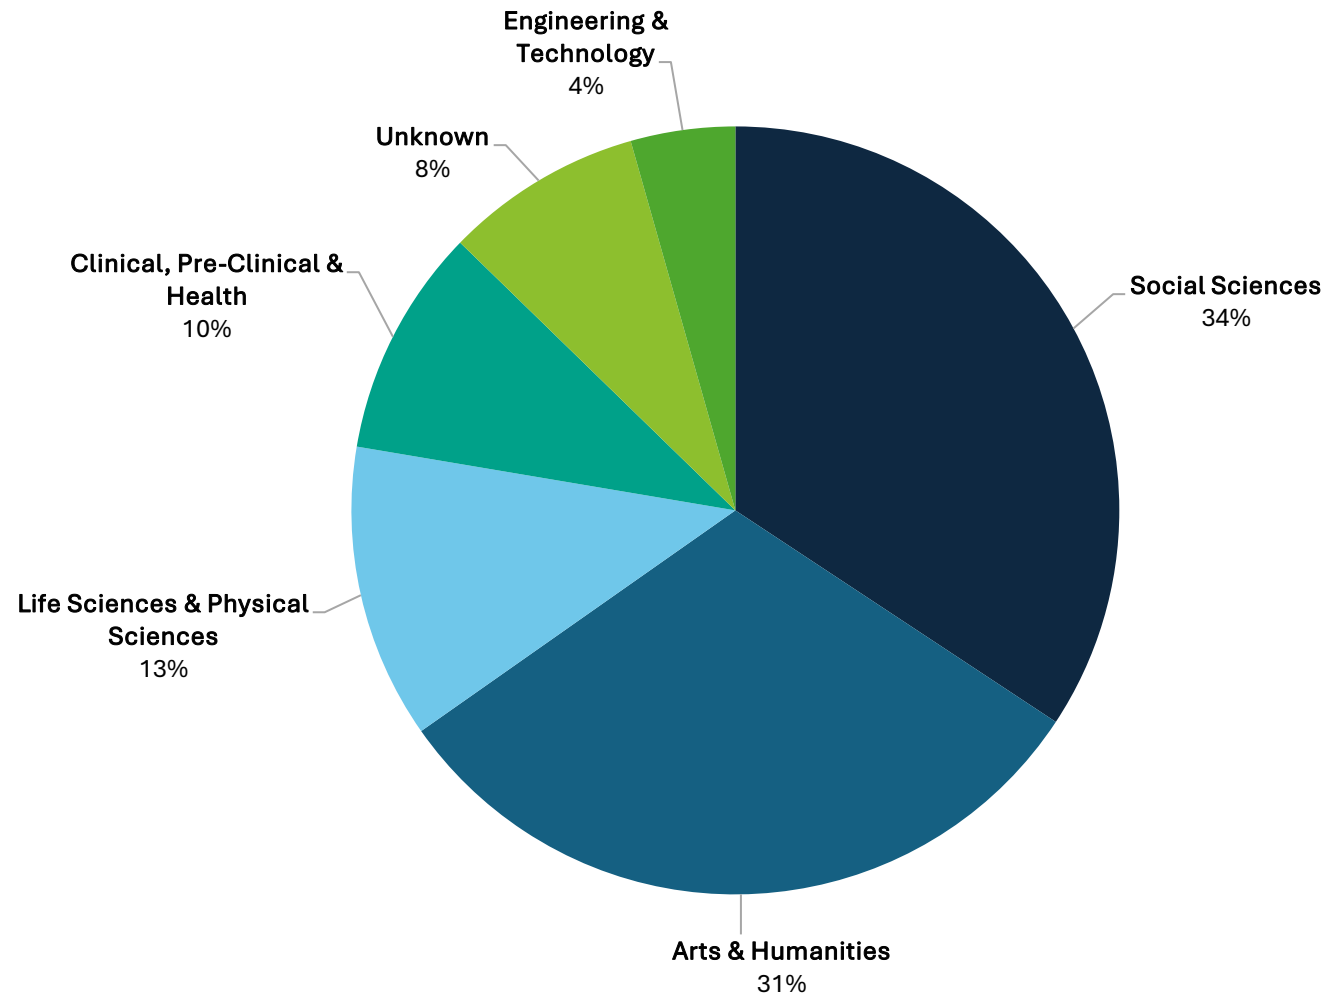

- A striking 68% (4,145,357 out of 6,084,125) of search terms were only searched once, confirming a long-tail distribution.
- Only 32% of terms were searched more than once, with only 0.1% searched 10 or more times.

What does this distribution indicate?

- Users have highly individualized needs
- Lack of uniformity in search string construction, with many variations of the same query
- Clustering similar search queries would yield more definitive results

# Categorization By Academic Discipline

# Categorization By Subject Classification

Note: About 8% of queries couldn't be assigned a category, usually because they were ambiguous personal names or lacked context.

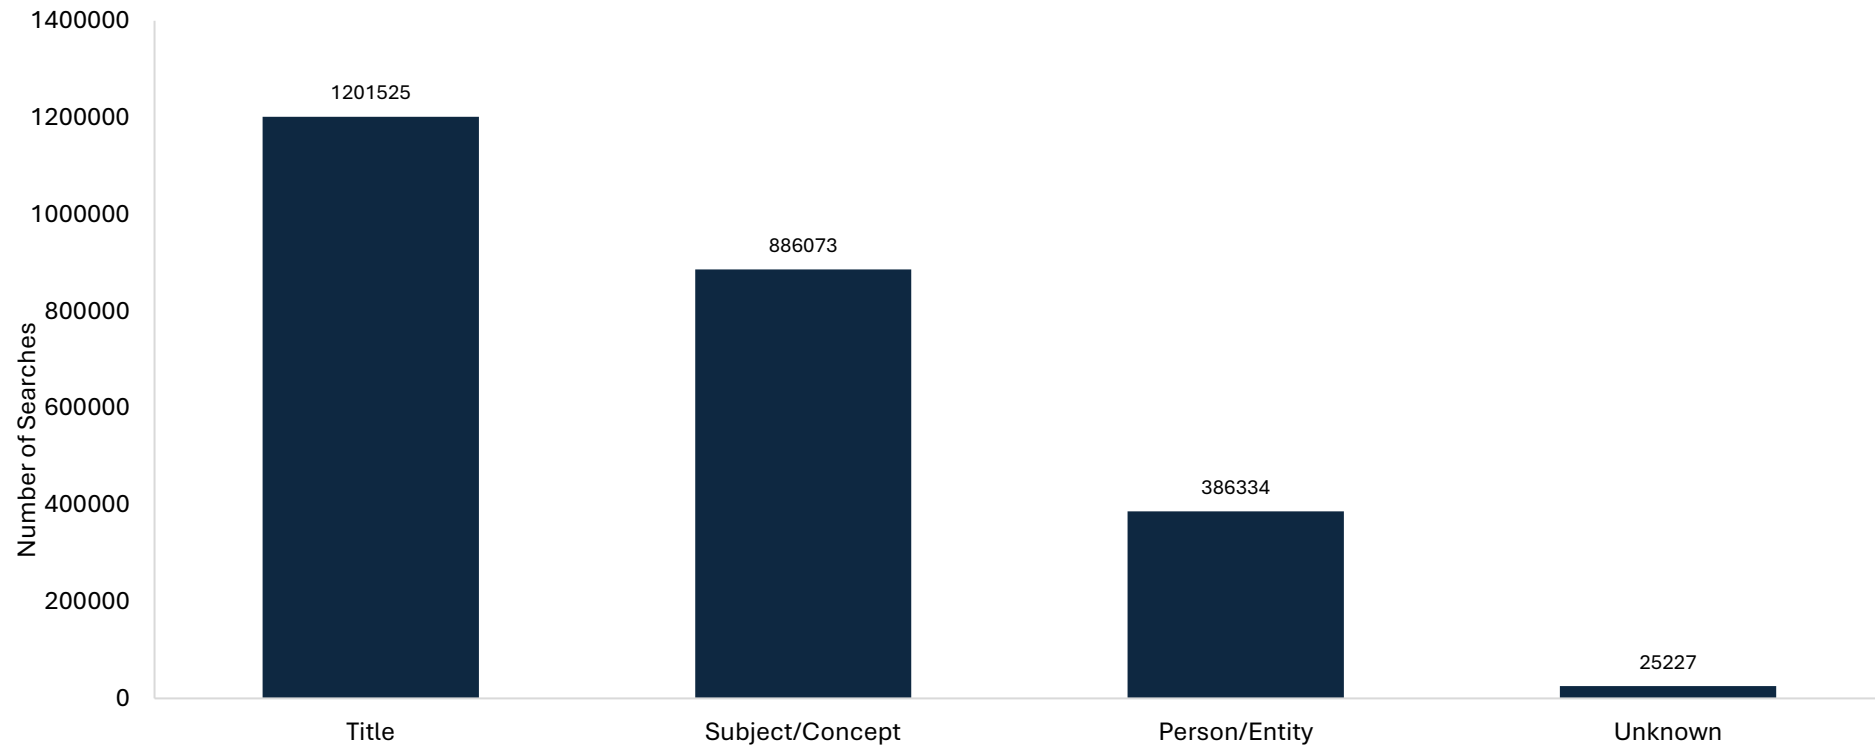

# Emerging Research Areas

AI can assist in detecting popular and emerging areas of research:

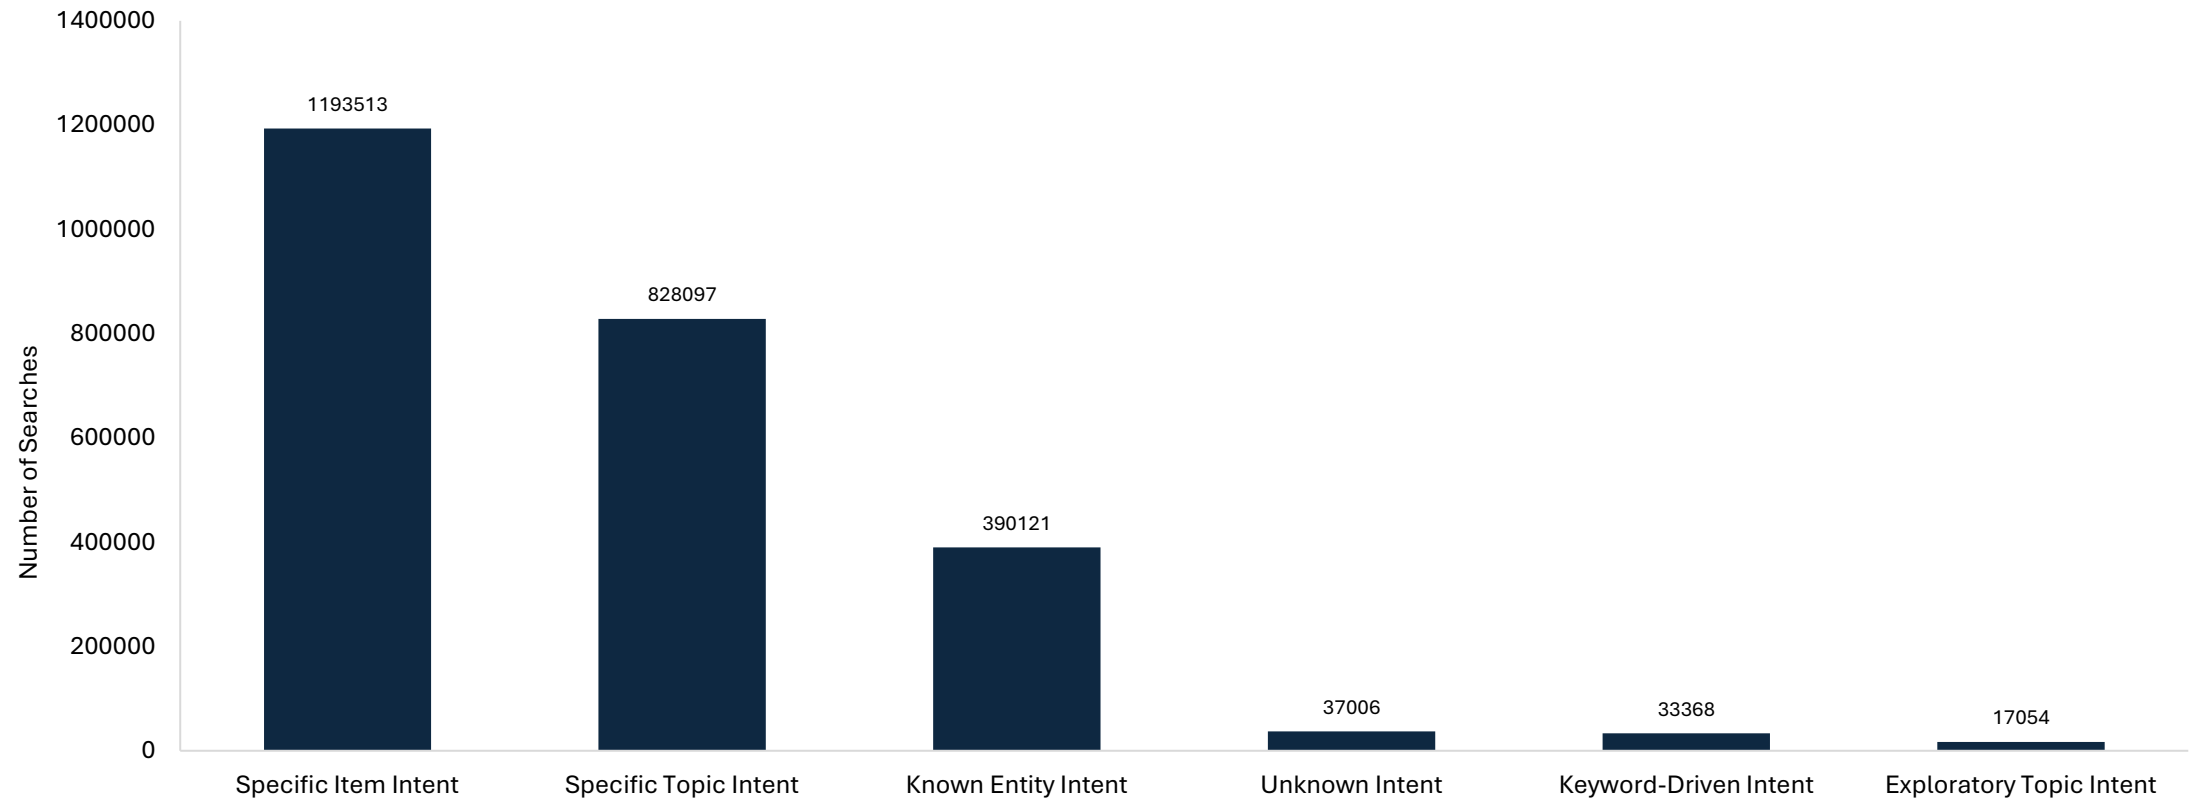

- Artificial Intelligence & Society
- Indigenous Studies & Decolonization
- Climate Change & Sustainability
- Mental Health & Well-being
- Intersectionality & Social Justice
- Digital Media & Surveillance

# Categorization By Search Type

# Categorization By User Intent

# **Top Insights from the Research**

# Key Takeaways About User Behavior

- Search begins ELSEWHERE (Google, Google Scholar, PubMed, social media, etc.)
- Frequent full citations or author-title queries suggest known-item retrieval dominates over exploratory searching

The Google logo, consisting of the word "Google" in its characteristic multi-colored font.The PubMed logo, featuring the word "PubMed" in blue, with a stylized graphic of a book or document icon integrated into the letter "M".The Google Scholar logo, featuring the word "Google" in its characteristic multi-colored font, followed by the word "Scholar" in a grey sans-serif font. Above the text is a blue icon consisting of a diamond shape with a circle inside it.

# Key Takeaways About User Behavior

Users prioritize efficiency and frequently rely on copy-paste to enter search terms

Long, encoded query strings (e.g., %26 for &) suggest inputs are pasted from syllabi, citation managers, or bibliographies

Unexpected copy-paste patterns observed in queries:

- Full abstract text
- Publication extent statements (e.g., 256 p. ; ill.)
- The letter 'v' – unsuccessful paste action

# Key Takeaways About User Behavior

Single search box is heavily preferred; users rarely engage with advanced search interface

Fielded searching and Boolean logic (AND, OR, NOT) are infrequently used

Quotation marks and parentheses to control search logic are seldom applied

Precision search techniques remain uncommon despite their potential to improve results

# Current State of AI Research Tools

Most AI integrations today are siloed chatbots bolted onto existing research platforms.

These implementations offer a quick win for vendors eager to showcase AI capabilities.

For users, the result is often a fragmented search experience, leading to uncertainty about where or how to begin their research.

# A Better Path Forward

From siloed “research assistants” to integrated “research assistance”

thank you!
